Background:

Skanska was challenged with having a very limited project site area and setback requirements for a building needed to house contractors working on the largest DOT project to date project to date in Washington, DC. Wilmot collaborated with Skanska to create a solution that would balance its needs and maximize the space required for the project's offices and conference areas. Skanska's job duties include the demolition, restoration and renovation of several bridges within the District of Columbia. The building serves as the Project Headquarters for the duration of the project, which is estimated to be five years.
