

USE: Worldwide Headquarters for International Shipping Company

SIZE: 4,332 Square Feet 2-Story

NEED

The customer needed a permanent facility that had to be in place and operational in a short time span. For that reason, the customer chose a modular building.

SOLUTION & FEATURES

We met all site-built expectations and were able to install the building in just 55 days to meet the customers quick operational timeline. The building consists of six modules and was designed in the factory to encompass a site-built elevator shaft. Large amounts of windows on the north end allow visibility of incoming and outgoing cargo from both stories. Due to the large quantities of glass, all rooms have duct heaters to regulate cool air flow should excessive cooling be called for at the main thermostat.

- Permanent installation on perimeter foundation
- Contemporary architectural design
- 2-story elevator lobby/entrance encased in glass
- Ceramic tile floors and walls in bathrooms
- Vinyl Gypsum walls, quarry tile and t-grid ceiling
- Fixed Tinted Low-E Insulated Windows
- Exterior finish consists of 5/16" fiberglass panels installed in a symmetrical pattern with window placement.
